

Test Bank - Pharmacotherapeutics for Advanced Practice A Practicle Approach 5th Edition

Chapter 1 : Issues for the Practitioner in Drug Therapy

MULTIPLE CHOICE :

1. Nurse practitioner prescriptive authority is regulated by:
 - A. The National Council of State Boards of Nursing
 - B. The U.S. Drug Enforcement Administration
 - C. The State Board of Nursing for each state
 - D. The State Board of PharmacyANS: C PTS: 1
2. Physician Assistant (PA) prescriptive authority is regulated by:
 - A. The National Council of State Boards of Nursing
 - B. The U.S. Drug Enforcement Administration
 - C. The State Board of Nursing
 - D. The State Board of Medical ExaminersANS: D PTS: 1
3. Clinical judgment in prescribing includes:
 - A. Factoring in the cost to the patient of the medication prescribed
 - B. Always prescribing the newest medication available for the disease process
 - C. Handing out drug samples to poor patients
 - D. Prescribing all generic medications to cut costsANS: A PTS: 1
4. Criteria for choosing an effective drug for a disorder include:
 - A. Asking the patient what drug they think would work best for them
 - B. Consulting nationally recognized guidelines for disease management
 - C. Prescribing medications that are available as samples before writing a prescription
 - D. Following U.S. Drug Enforcement Administration (DEA) guidelines for prescribingANS: B PTS: 1
5. Nurse practitioner practice may thrive under health-care reform due to:
 - A. The demonstrated ability of nurse practitioners to control costs and improve patient outcomes
 - B. The fact that nurse practitioners will be able to practice independently
 - C. The fact that nurse practitioners will have full reimbursement under health-care reform
 - D. The ability to shift accountability for Medicaid to the state levelANS: A PTS: 1

Chapter 2. Pharmacokinetic Basis of Therapeutics and Pharmacodynamic

MULTIPLE CHOICE

1. A patient's nutritional intake and lab work reflects hypoalbuminemia. This is critical to prescribing because:
- A. Distribution of drugs to target tissue may be affected
 - B. The solubility of the drug will not match the site of absorption
 - C. There will be less free drug available to generate an effect
 - D. Drugs bound to albumin are readily excreted by the kidney

ANS: A PTS: 1

2. Drugs that have a significant first-pass effect:
- A. Must be given by the enteral (oral) route only
 - B. Bypass the hepatic circulation
 - C. Are rapidly metabolized by the liver and may have little if any desired action
 - D. Are converted by the liver to more active and fat-soluble forms

ANS: C PTS: 1

3. The route of excretion of a volatile drug will likely be:
- A. The kidneys
 - B. The lungs
 - C. The bile and feces
 - D. The skin

ANS: B PTS: 1

4. Medroxyprogesterone (Depo Provera) is prescribed IM to create a storage reservoir of the drug. Storage reservoirs:
- A. Assure that the drug will reach its intended target tissue
 - B. Are the reason for giving loading doses
 - C. Increase the length of time a drug is available and active
 - D. Are most common in collagen tissues

ANS: C PTS: 1

5. The NP chooses to give cephalexin every 8 hours based on knowledge of the drug's:
- A. Propensity to go to the target receptor
 - B. Biological half-life
 - C. Pharmacodynamics
 - D. Safety and side effects

ANS: B PTS: 1

6. Azithromycin dosing requires the first day's dose be twice those of the other 4 days of the prescription. This is considered a loading dose. A loading dose:
- A. Rapidly achieves drug levels in the therapeutic range
 - B. Requires four to five half-lives to attain
 - C. Is influenced by renal function

D. Is directly related to the drug circulating to the target tissues

ANS: A PTS: 1

7. The point in time on the drug concentration curve that indicates the first sign of a therapeutic effect is the:
- A. Minimum adverse effect level
 - B. Peak of action
 - C. Onset of action
 - D. Therapeutic range

ANS: C PTS: 1

8. Phenytoin requires a trough level be drawn. Peak and trough levels are done:
- A. When the drug has a wide therapeutic range
 - B. When the drug will be administered for a short time only
 - C. When there is a high correlation between the dose and saturation of receptor sites
 - D. To determine if a drug is in the therapeutic range

ANS: D PTS: 1

9. A laboratory result indicates the peak level for a drug is above the minimum toxic concentration. This means that the:
- A. Concentration will produce therapeutic effects
 - B. Concentration will produce an adverse response
 - C. Time between doses must be shortened
 - D. Duration of action of the drug is too long

ANS: B PTS: 1

10. Drugs that are receptor agonists may demonstrate what property?
- A. Irreversible binding to the drug receptor site
 - B. Up-regulation with chronic use
 - C. Desensitization or down-regulation with continuous use
 - D. Inverse relationship between drug concentration and drug action

ANS: C PTS: 1

11. Drugs that are receptor antagonists, such as beta blockers, may cause:
- A. Down-regulation of the drug receptor
 - B. An exaggerated response if abruptly discontinued
 - C. Partial blockade of the effects of agonist drugs
 - D. An exaggerated response to competitive drug agonists

ANS: B PTS: 1

12. Factors that affect gastric drug absorption include:
- A. Liver enzyme activity
 - B. Protein-binding properties of the drug molecule
 - C. Lipid solubility of the drug
 - D. Ability to chew and swallow

ANS: C PTS: 1

13. Drugs administered via intravenous (IV) route:
- A. Need to be lipid soluble in order to be easily absorbed
 - B. Begin distribution into the body immediately
 - C. Are easily absorbed if they are nonionized
 - D. May use pinocytosis to be absorbed

ANS: B PTS: 1

14. When a medication is added to a regimen for a synergistic effect, the combined effect of the drugs is:
- A. The sum of the effects of each drug individually
 - B. Greater than the sum of the effects of each drug individually
 - C. Less than the effect of each drug individually
 - D. Not predictable, as it varies with each individual

ANS: B PTS: 1

15. Which of the following statements about bioavailability is true?
- A. Bioavailability issues are especially important for drugs with narrow therapeutic ranges or sustained release mechanisms.
 - B. All brands of a drug have the same bioavailability.
 - C. Drugs that are administered more than once a day have greater bioavailability than drugs given once daily.
 - D. Combining an active drug with an inert substance does not affect bioavailability.

ANS: A PTS: 1

16. Which of the following statements about the major distribution barriers (blood-brain or fetal-placental) is true?
- A. Water soluble and ionized drugs cross these barriers rapidly.
 - B. The blood-brain barrier slows the entry of many drugs into and from brain cells.
 - C. The fetal-placental barrier protects the fetus from drugs taken by the mother.
 - D. Lipid soluble drugs do not pass these barriers and are safe for pregnant women.

ANS: B PTS: 1

17. Drugs are metabolized mainly by the liver via Phase I or Phase II reactions. The purpose of both of these types of reactions is to:
- A. Inactivate prodrugs before they can be activated by target tissues
 - B. Change the drugs so they can cross plasma membranes
 - C. Change drug molecules to a form that an excretory organ can excrete
 - D. Make these drugs more ionized and polar to facilitate excretion

ANS: C PTS: 1

18. Once they have been metabolized by the liver, the metabolites may be:
- A. More active than the parent drug
 - B. Less active than the parent drug
 - C. Totally “deactivated” so that they are excreted without any effect
 - D. All of the above

ANS: D PTS: 1

19. All drugs continue to act in the body until they are changed or excreted. The ability of the body to excrete drugs via the renal system would be increased by:
- A. Reduced circulation and perfusion of the kidney
 - B. Chronic renal disease
 - C. Competition for a transport site by another drug
 - D. Unbinding a nonvolatile drug from plasma proteins

ANS: D PTS: 1

20. Steady state is:
- A. The point on the drug concentration curve when absorption exceeds excretion
 - B. When the amount of drug in the body remains constant
 - C. When the amount of drug in the body stays below the MTC
 - D. All of the above

ANS: B PTS: 1

21. Two different pain meds are given together for pain relief. The drug-drug interaction is:
- A. Synergistic
 - B. Antagonistic
 - C. Potentiative
 - D. Additive

ANS: D PTS: 1

22. Actions taken to reduce drug-drug interaction problems include all of the following EXCEPT:
- A. Reducing the dose of one of the drugs
 - B. Scheduling their administration at different times
 - C. Prescribing a third drug to counteract the adverse reaction of the combination
 - D. Reducing the dosage of both drugs

ANS: C PTS: 1

23. Phase I oxidative-reductive processes of drug metabolism require certain nutritional elements. Which of the following would reduce or inhibit this process?
- A. Protein malnutrition
 - B. Iron deficiency anemia
 - C. Both A and B
 - D. Neither A nor B

ANS: D PTS: 1

24. The time required for the amount of drug in the body to decrease by 50% is called:
- A. Steady state
 - B. Half-life
 - C. Phase II metabolism
 - D. Reduced bioavailability time

ANS: B PTS: 1

25. An agonist activates a receptor and stimulates a response. When given frequently over time the body may:
- A. Up-regulate the total number of receptors
 - B. Block the receptor with a partial agonist
 - C. Alter the drug's metabolism
 - D. Down-regulate the numbers of that specific receptor

ANS: D PTS: 1

26. Drug antagonism is best defined as an effect of a drug that:
- A. Leads to major physiologic psychological dependence
 - B. Is modified by the concurrent administration of another drug
 - C. Cannot be metabolized before another dose is administered
 - D. Leads to a decreased physiologic response when combined with another drug

ANS: B PTS: 1

27. Instructions to a client regarding self-administration of oral enteric-coated tablets should include which of the following statements?
- A. "Avoid any other oral medicines while taking this drug."
 - B. "If swallowing this tablet is difficult, dissolve it in 3 ounces of orange juice."
 - C. "The tablet may be crushed if you have any difficulty taking it."
 - D. "To achieve best effect, take the tablet with at least 8 ounces of fluid."

ANS: D PTS: 1

28. The major reason for not crushing a sustained release capsule is that, if crushed, the coated beads of the drugs could possibly result in:
- A. Disintegration
 - B. Toxicity
 - C. Malabsorption
 - D. Deterioration

ANS: B PTS: 1

29. Which of the following substances is the most likely to be absorbed in the intestines rather than in the stomach?
- A. Sodium bicarbonate
 - B. Ascorbic acid
 - C. Salicylic acid
 - D. Glucose

ANS: A PTS: 1

30. Which of the following variables is a factor in drug absorption?
- A. The smaller the surface area for absorption, the more rapidly the drug is absorbed.
 - B. A rich blood supply to the area of absorption leads to better absorption.
 - C. The less soluble the drug, the more easily it is absorbed.
 - D. Ionized drugs are easily absorbed across the cell membrane.

ANS: B PTS: 1

31. An advantage of prescribing a sublingual medication is that the medication is:

- A. Absorbed rapidly
- B. Excreted rapidly
- C. Metabolized minimally
- D. Distributed equally

ANS: A PTS: 1

32. Drugs that use CYP 3A4 isoenzymes for metabolism may:

- A. Induce the metabolism of another drug
- B. Inhibit the metabolism of another drug
- C. Both A and B
- D. Neither A nor B

ANS: C PTS: 1

33. Therapeutic drug levels are drawn when a drug reaches steady state. Drugs reach steady state:

- A. After the second dose
- B. After four to five half-lives
- C. When the patient feels the full effect of the drug
- D. One hour after IV administration

ANS: B PTS: 1

34. Up-regulation or hypersensitization may lead to:

- A. Increased response to a drug
- B. Decreased response to a drug
- C. An exaggerated response if the drug is withdrawn
- D. Refractoriness or complete lack of response

ANS: C PTS: 1

Chapter 3. Impact of Drug Interactions and Adverse Events on Therapeutics

MULTIPLE CHOICE

1. Which of the following patients would be at higher risk of experiencing adverse drug reactions (ADRs):
- A. A 32-year-old male
 - B. A 22-year-old female
 - C. A 3-month-old female
 - D. A 48-year-old male

ANS: C PTS: 1

2. Infants and young children are at higher risk of ADRs due to:
- A. Immature renal function in school-age children
 - B. Lack of safety and efficacy studies in the pediatric population
 - C. Children's skin being thicker than adults, requiring higher dosages of topical medication
 - D. Infant boys having a higher proportion of muscle mass, leading to a higher volume of distribution

ANS: B PTS: 1

3. The elderly are at high risk of ADRs due to:
- A. Having greater muscle mass than younger adults, leading to higher volume of distribution
 - B. The extensive studies that have been conducted on drug safety in this age group
 - C. The blood-brain barrier being less permeable, requiring higher doses to achieve therapeutic effect
 - D. Age-related decrease in renal function

ANS: D PTS: 1

4. The type of adverse drug reaction that is the result of an unwanted but otherwise normal pharmacological action of a drug given in the usual therapeutic doses is
- A. Type A
 - B. Type B
 - C. Type C
 - D. Type D

ANS: A PTS: 1

5. Digoxin may cause a Type A adverse drug reaction due to:
- A. Idiosyncratic effects
 - B. Its narrow therapeutic index
 - C. Being a teratogen
 - D. Being a carcinogen

ANS: B PTS: 1

6. Changes in the individual pharmacokinetic parameters of adsorption, distribution, or elimination may result in high concentrations of the drug in the body, leading to which type of adverse drug reaction?
- A. Type A
 - B. Type C
 - C. Type D
 - D. Type E

ANS: A PTS: 1

7. According to the World Health Organization Classification, Type B adverse reactions are:
- A. When a drug is a teratogen
 - B. When a drug is carcinogenic
 - C. A delayed ADR, such as renal failure
 - D. An allergic or idiosyncratic response

ANS: D PTS: 1

8. Sarah developed a rash after using a topical medication. This is a Type___allergic drug reaction.
- A. I
 - B. II
 - C. III
 - D. IV

ANS: D PTS: 1

9. A patient may develop neutropenia from using topical Silvadene for burns. Neutropenia is a(n):
- A. Cytotoxic hypersensitivity reaction
 - B. Immune complex hypersensitivity
 - C. Immediate hypersensitivity reaction
 - D. Delayed hypersensitivity reaction

ANS: A PTS: 1

10. Anaphylactic shock is a:
- A. Type I reaction, called immediate hypersensitivity reaction
 - B. Type II reaction, called cytotoxic hypersensitivity reaction
 - C. Type III allergic reaction, called immune complex hypersensitivity
 - D. Type IV allergic reaction, called delayed hypersensitivity reaction

ANS: A PTS: 1

11. James has hypothalamic-pituitary-adrenal axis suppression from chronic prednisone (a corticosteroid) use. He is at risk for what type of adverse drug reaction?
- A. Type B
 - B. Type C
 - C. Type E
 - D. Type F

ANS: B PTS: 1

12. The treatment for a patient who experiences hypothalamic-pituitary-adrenal axis suppression while taking the corticosteroid prednisone, a Type C adverse drug reaction, is to:
- A. Immediately discontinue the prednisone
 - B. Administer epinephrine
 - C. Slowly taper the patient off of the prednisone
 - D. Monitor for long-term effects, such as cancer

ANS: C PTS: 1

13. The ACE inhibitor lisinopril is a known teratogen. Teratogens cause Type_____adverse drug reaction.
- A. A
 - B. B
 - C. C
 - D. D

ANS: D PTS: 1

14. Cardiac defects are a known Type D adverse drug reaction to lithium. Lithium causes a Type D adverse drug reaction because it is:
- A. An immunosuppressant
 - B. A carcinogen
 - C. A teratogen
 - D. An antiseizure medication

ANS: C PTS: 1

15. Immunomodulators such as azathioprine may cause a delayed adverse drug reaction known as a Type D reaction because they are known:
- A. Teratogens
 - B. Carcinogens
 - C. To cause hypersensitivity reactions
 - D. Hypothalamus-pituitary-adrenal (HPA) axis suppressants

ANS: B PTS: 1

16. A 24-year-old male received multiple fractures in a motor vehicle accident that required significant amounts of opioid medication to treat his pain. He is at risk for Type____adverse drug reaction when he no longer requires the opioids.
- A. A
 - B. C
 - C. E
 - D. G

ANS: C PTS: 1

17. Drugs that may cause a Type E adverse drug reaction include:
- A. Beta blockers
 - B. Immunomodulators
 - C. Antibiotics
 - D. Oral contraceptives

ANS: A PTS: 1

18. Unexpected failure of drug therapy is a Type___adverse drug reaction, commonly caused by_____.
- A. B; cytotoxic hypersensitivity
 - B. B; idiosyncratic response
 - C. C; cumulative effects of drug
 - D. F; drug-drug interaction

ANS: D PTS: 1

19. Clopidogrel treatment failure may occur when it is co-administered with omeprazole, known as a Type___adverse drug reaction.
- A. A
 - B. C
 - C. E
 - D. F

ANS: D PTS: 1

Chapter 4. Pregnancy and Lactation

MULTIPLE CHOICE

1. The client has been prescribed Doxylamine (Unisom) for treatment of nausea and vomiting during pregnancy. What aspect of the client's history will cause the nurse to contact the primary health care provider?
 - a. Arthritis
 - b. Depression
 - c. Asthma
 - d. Hyperglycemia

ANS: C PTS: 1

2. The nurse is teaching a group of pregnant women the importance of adequate nutrition for the fetus. The nurse instructs the clients that folic acid deficiency during preconception and early in pregnancy can result in:
 - a. skeletal defects.
 - b. neural tube defects.
 - c. intrauterine growth retardation.
 - d. small-for-gestational-age infants.

ANS: B PTS: 1

3. A client is ordered to receive iron and antacids. The nurse teaches the client that iron and antacids should be administered:
 - a. at the same time.
 - b. 2 hours apart.
 - c. with the antacid first.
 - d. with the iron first.

ANS: B PTS: 1

4. A client, 10 weeks pregnant, complains of severe nausea of pregnancy. Meclizine (Bonine) is prescribed. The client reports to the nurse that she has begun to experience dizziness. What is the highest priority nursing intervention?
 - a. Contact the pharmacist; this indicates an overdosage of the medication.
 - b. Contact the physician; this is an expected side effect of the medication.
 - c. Contact the pharmacist; this indicates incorrect preparation of the medication.
 - d. Contact the physician; this is an adverse reaction to the medication.

ANS: B PTS: 1

5. A client complains of severe pregnancy-related nausea and is placed on Meclizine (Bonine). The nurse notes in the client history that the client is undergoing treatment for glaucoma. What is the highest priority nursing intervention?
 - a. Recognize that one of the off-label uses for the drug is treatment of glaucoma.
 - b. Contact the pharmacist; the dosage of the drug should be decreased when glaucoma is present.
 - c. Recognize that use of the drug when glaucoma is present may result in a fatal
